

The E-75 database was used as the starting point for the E-75-2 project. In the course of the E-75-2 project, some errors were found in the E-75 database and corrected in the E-75-2 database. However, the E-75 database contains additional data fields that were not needed for the E-75-2 analysis and so are not included in the E-75-2 database. Therefore, the original E-75 database is still useful in providing these additional data fields, but the user should first verify that the emissions data is correct by finding the corresponding emissions data record in the E-75-2 database.
