

The original E-75 Diesel Speciation Database was reformatted to perform the E-75-2 data analysis, and fields not required for the analysis were eliminated. As described in the E-75-2 report, this second database contains some added records, and some records from the original database have been screened out. Sufficient identifying information is included in the E-75-2 database to map it back to the original data record in the E-75 database. It is provided here for your convenience.
